## Results for the 1997-1999 CINCH

## Introduction

The Components of Inventory Change (CINCH) report measures changes in the characteristics of the housing stock of the United States. Using data collected from the national American Housing Survey (AHS), conducted every two years, the characteristics of individual housing units are compared across time. This comparison allows researchers to see not only changes in the characteristics of housing units, but also in the characteristics of occupants. Information is available on the characteristics of units added and removed from the housing stock.

First-time users of this publication are advised to refer to the Appendices for explanations of the columns and how to interpret the results. The Appendices also contain the definitions of all of the characteristics, cautions, and explanations about some of the results.

This document is one of a series of reports covering two-year intervals. All of the reports are based on the American Housing Survey. The results presented here are not directly comparable to "Components of Inventory Change: 1980-1991," or "Components of Inventory Change: 1980-1993." They are consistent with the previous series of two year reports, starting with the 1987 AHS.

## Findings

Here are some highlights of the findings in this CINCH report. See the tables for details and additional information.

Table 1:
Units in Structure. Between 1997 and 1999, the number of units of all types increased, with single-family, detached units experiencing the greatest increase in absolute terms. Most of these units were added through new construction.

Removal of Units. In absolute terms, units built between 1960 and 1979 were lost more than other time periods.

Metro/Nonmetropolitan Areas. Most of the new construction occurred in the suburbs. During this period, the suburbs grew at a faster rate than did central cities, indicating a gradual shift from central cities toward the suburbs.

Tenure. The number of owner-occupied units increased from 1997 to 1999 by more than a million units. The proportion of owner-occupied units versus renter-occupied units also increased over this time period - from about 66 percent owner-occupied in 1997 to 68 percent in 1999. This increase can be partially attributed to new construction. The homeownership rate in new construction is approximately $84 \%$.

Table 2:
Stories in Structure. The number of three-story multiunit structures increased between 1997 and 1999. A majority of these new three-story units were added through new construction.

External Building Conditions. Between 1997 and 1999, the number of housing units in multiunit buildings reporting undesirable external building conditions decreased. Most of the units reporting such conditions in 1999 did not report the same conditions in 1997.

Rooms. The median number of rooms for a unit lost from the housing stock was 4.8 rooms. In contrast, the median number of rooms for a unit added to the housing stock was 5.8 rooms. This size increase is driven primarily by newly constructed units, which had a median size of 5.9 rooms.

Square Footage of Units. The change in the square footage of units is similar to the change in number of rooms. Units added to the stock tended to be slightly larger with more square footage than units removed from the housing stock. Units added to the stock had a median square footage of 1,650 square feet, while units removed from the stock had a median size of 989 square feet. Units present and unchanged in both years had a median size of approximately 1,700 square feet.

Table 3:
Equipment. Between 1997 and 1999, the number of housing units lacking complete kitchen facilities declined by approximately 500,000 units. Units reporting no kitchen facilities in 1999 were lost over this two-year period to demolition or disaster, were condemned or badly damaged, or were changed to a non-residential use. However, approximately 1.4 million units remained with incomplete kitchen facilities.

Air Conditioning. Units lost from the housing stock between 1997 and 1999 tended to lack any type of air conditioning, while the majority of units added to the housing stock had central air conditioning built into the unit during this same period.

Main Heating Equipment. By 1999, most of newly constructed units used warm-air furnaces. During this same period, electric heat pumps were used in new construction at a rate exceeding their proportion in existing units in 1999. This indicates an increasing share of units with electric heat pumps.

Main Housing Heating Fuel. More units using fuel oil, kerosene, or wood were removed from the housing stock than added to it. There were overall net declines in the number of units using these sources as their primary fuel.

Table 4:
Selected Amenities. Of units added through new construction, the majority included porches, garages (or carports), and approximately onehalf included working fireplaces. In contrast, only about one third of existing units had fireplaces. Of the units lost, however, less than half had porches, and less than one-tenth had working fireplaces.

Selected Deficiencies. Most of the units with deficiencies in 1997 were still in the housing stock in 1999, but without the deficiency, indicating that the deficiency was corrected. Overall, there were declines in every category of deficiency between 1997 and 1999. The most common deficiency between 1997 and 1999 was open cracks or interior holes.

Bars on Windows of Buildings. In 1997, there was a decrease in the number of housing units
reporting bars on the windows of buildings within 300 feet of their homes.

Water Supply Stoppage. Occupied households reporting water supply stoppages decreased from 1999 to 1997. Those units reporting a water supply stoppage in 1999 did not also report a stoppage in 1997.

Selected Physical Problems. Overall, the number of units with moderate physical problems remained approximately constant over the two year period. However, most units that had physical problems in 1999 were fixed by 1997, but some units which had been in adequate shape in 1997 had deteriorated in quality by 1999 .

## Table 5:

Number of Single Children Under 18 Years Old. Between 1997 and 1999, the number of housing units reporting children under 18 years old remained approximately the same. Units added to the housing stock through new construction over this time were generally occupied by families with none, one, or two children under 18 years old.

Number of Persons in Household. Households in units added to the housing stock had a median number of people of 2.6. Most households consisted of one, two, or three persons, remaining unchanged between 1997 and 1999.

Years of School Completed by Householder. Householders of units added to the stock tended to have higher levels of education than the universe of householders as a whole. The median householder in 1997 has just less than one year of post-secondary education. In contrast, the median householder of a unit added to the housing stock had over two years of post-secondary education.

Table 6:
Please see the Appendix for cautions about interpreting financial information.

Monthly Housing Costs. Overall, housing units reported higher monthly housing costs in 1999 than in 1997. Units lost from the housing stock generally had lower than average monthly housing costs while those added reported higher
costs. The median monthly housing cost was \$509 in 1997 and \$575 in 1999.

Property Value. The median property value increased dramatically between 1997 and 1999. The median value in 1997 was approximately $\$ 99,000$ while the median value in 1999 was approximately $\$ 115,000$. Part of this change may be due to general inflation and house price appreciation. The contrast in value between units gained and lost to the housing stock is also dramatic. The median value of a unit removed from the stock was approximately $\$ 31,000$, while the median value of a unit added to the housing stock was just over 115,000.

Household Income. Between 1997 and 1999, the number of housing units reporting relatively high household incomes increased while the number of units reporting relatively low incomes decreased. Units added to the housing stock were generally occupied by households with moderate to higher incomes.

## Data Availability

The CINCH reports and the underlying American Housing Survey national sample data are available from:

HUD USER (Phone: 1-800-245-2691)
Box 23268
Washington, DC 20026-3268
Web: http://www.huduser.org/

## Acknowledgements

The report was produced by the ICF Consulting Group under the task order "Analytical Support for the American Housing Survey" under the MOBIS contract for the U.S. Department of Housing and Urban Development. David A. Vandenbroucke, Economist, of HUD's Office of Policy Development and Research, was responsible for overseeing the contractor. Valuable advice and comments was also provided by Ronald J. Sepanik.

At ICF, Gregory J. Watson managed the production of the reports. ICF staff assisting in the development of the reports include: Caroline McCarthy and Mark Sanford. Opinions expressed are those of the contractor and do not necessarily reflect the views of HUD.

# Components of Inventory Change: 1997-1999 

## Appendices

Endnotes
Cautions
Definitions
Algorithm Description
Weighting Description

## Appendix: Endnotes

1. By definition, an existing structure cannot change the number of units present without conversions, mergers or a change in the structure. As a result, there are no changes in characteristic possible for this item, and any changes will be captured by other columns.
2. When comparing the numbers for "Year Structure Built" with other CINCH reports, the user may find apparent inconsistencies in the number of units built in a given time period. Although such differences are expected for time periods that include the survey years, they occur in past years as well. These differences are a result of the method used to weight the AHS data. The algorithm that generates the CINCH tables uses the greater of the weight values in the PWT (Pure Weight) variable for each of the two years in the comparison. This method ensures that numbers are consistent within any given CINCH report, but it is possible for minor differences to occur when comparing reports.
3. Due to the small likelihood that the number of stories in a structure would change between the two comparison years, a decision was made to prohibit the number of stories in structure from changing. Therefore, the units in each Stories in Structure category do not sum to the universe line. The difference, however, is small.
4. Limited to multiunit structures.
5. The numbers presented for external building conditions that could not be observed or were not reported are higher than previously published in AHS reports. We believe it is possible that the data have been updated since the AHS publications.
6. More than one item may apply to the housing unit.
7. Limited to single detached and mobile homes.
8. Due to the prevalence of respondents who do not know their housing unit's exact lot size, a decision was made to prohibit lot size from changing between the two comparison years. Therefore, the units in each Lot Size category do not sum to the universe line for the first year. The difference, however, is small.
9. The numbers presented for housing units that have neither burners nor ovens are higher than previously published in AHS reports. It is possible that the data have been updated since the AHS publications.
10. Census believes these data are less reliable than other data in the AHS. As a result, they have suppressed this item on some AHS reports. Caution should be exercised in using this data.
11. A change in the number of people living in the sample unit will result in a change in characteristic here.
12. Values at the extreme upper range do not appear due to top-coding on the public use file released by the Census Bureau.

## Appendix: Endnotes -- Changes from the 1985-1997 reports

1. Certain data is no longer present on the AHS, this includes whether or not equipment is more than 5 years old, and the household income as a percentage of poverty.
2. "Other additions" was computed as a residual in the earlier years. With the data improvement starting in 1997, this column was no longer needed. However, for consistency in being able to line things up, the column was left in and is blank.

## Appendix: Cautions

## Notes on the items described in the text

This text comments on only some of the changes that occurred in the housing stock over this two-year period covered by this CINCH report. While the text reflects changes that the authors noted and thought interesting, the items included for discussion were not selected according to any rigid definition or policy. Inclusion or exclusion of an item should not be taken as an explicit or implicit commentary on the value placed on that data.

These findings are based solely on the two-year period covered by this report and have not been analyzed in relation to other pairs of years.

## Cautions

As with most publications reporting aggregate figures from a sample survey, users should exercise care when citing these numbers. Because of collection and reporting restrictions implicit in the American Housing Survey (AHS), each CINCH report also has certain limitations that cannot be overcome.

The raw data comes from the American Housing Survey National Sample (AHS), a survey of over 40,000 housing units in the United States that is conducted every two years. Each survey year, the same units are interviewed, and new housing units are added to reflect additions to the housing stock. Further details about the AHS can be found in all AHS publications and codebooks.

## General Data Issues

While the CINCH reports reflect the quality control used for each AHS dataset, some data quality issues arose in these two-year analyses that are not relevant to single-year analyses. For each data quality issue that arose, we developed and implemented a workable solution to preserve the integrity of the data and the reports. While this method can be called into question because it alters the data, we think that it adds to the legitimacy to the CINCH reports. For example, while most respondents report identical data for items that should not change from year to year, some do mistakenly report different answers. The BUILT variable (year the structure was built), for example, should not change. However, respondents do at times misreport this item. Through several iterations, we changed the data as minimally and justifiably as possible to reflect a more accurate depiction of the year the structure was built.

## Number of units estimates

Although the figures reported in the CINCH reports are derived from the American Housing Survey, these figures will not match those published AHS reports in the same year. This is because the publications use different weighting variables. The published AHS reports use the WEIGHT variable which is the "adjusted weight variable." This is the weight representing the number of units that Census has determined the sample case represents. This weight can vary from year to year because of changes in the nonresponse rate and because Census tries to match control totals derived from other surveys. In contrast, the CINCH report uses the PWT or "pure weight variable." The pure weight represents the inverse of the probability of selection for the sample case. This variable is invariant over time and is thus more appropriate for comparing changes between survey years. As a result, the figures reported in the CINCH reports will be similar to the corresponding numbers in the published AHS reports, but they will not match exactly. Both AHS and CINCH should track each other over time. All numbers should therefore be viewed as approximations and not precise figures. Although the numbers of units may not be exact, they
will be approximately correct. Relative changes in numbers, such as increases and decreases in the housing stock, should be generally reliable but not exactly precise.

## Financial information

While the CINCH reports attempt to capture changes in the housing stock, the accurate reporting of legitimate changes in characteristics involving dollar values can present significant problems. Both respondent-reporting errors and data reporting constraints can lead to inaccurate conclusions. For example, respondents may lack the knowledge to report their household incomes accurately or may be reluctant to provide this information to the government. Further complicating the CINCH comparative reports, all financial information collected through the AHS is reported in nominal dollars with no conversion to a constant dollar base. As a result, inflation will naturally cause a gradual shifting in all characteristics involving dollars, and reported changes in these items may reflect inflationary effects rather than a significant change in household characteristic.

## Appendix: Definitions

Age of householder. The age classification refers to the age reported for the householder as of that person's last birthday.

Amount of savings and investments. These data are restricted to families and primary individuals with total incomes of $\$ 25,000$ per year or less. Savings includes savings in the bank or other financial institution. It also includes savings in money market accounts. Investments in a farm or business must be owned shares in a business or farm, owned percentage of the capital or $\infty$ sets, investment in a farm or business for which the investor holds a promissory note, or membership in a partnership that has any of the above. Other investments include stocks, bonds, rental property, real estate, antiques, art, certificates of deposit, IRA or KEOGH accounts, commodities, etc.

Annual taxes paid per $\$ 1,000$ value. The annual real estate taxes paid per $\$ 1,000$ value of the property (house and lot) are presented. This item includes special assessments, school taxes, county taxes, and any other real estate taxes. Excluded are payments on delinquent taxes due from prior years. Rebates are subtracted from the total. When the real estate taxes are included with the mortgage, a separate amount for the taxes is obtained. Medians for taxes per $\$ 1,000$ value are rounded to the nearest dollar.

Bars on windows of buildings. The statistics presented are based on the interviewer's personal observation for pre-1997 data. In 1997, the respondent was asked. The condition of the windows has no bearing on this item. The windows might be in perfect condition, but the bars might be there to protect against vandalism. Windows that are boarded up or covered with tin are not included.

Bedrooms. The number of bedrooms in the housing unit is the count of room used mainly for sleeping, used for other purposes. Rooms reserved for sleeping, such as guest rooms, even though used infrequently, are counted as bedrooms. On the other hand, rooms used mainly for other purposed, even though used also for sleeping, such as a living room with a hideaway bed, are not considered bedrooms. A housing unit consisting of only one room, such as a one-room efficiency apartment, is classified by definition as having no bedroom.

Central cities. Every metropolitan statistical area has at least one central city, which is usually its largest city. Smaller cities are also identified as central cities if they have at least 25,000 population and meet the following two commuting requirements. First, the city must have at least 75 jobs for each 100 residents who are employed. Second, no more than 60 percent of the city's resident workers may commute to jobs outside the city limits. In addition, any city with at least 250,000 population or at least 100,000 persons working within its corporate limits qualifies as a central city even if it fails to meet the above two commuting requirements. Finally, in certain smaller metropolitan statistical areas, there are places with between 15,000 and 25,000 population that also qualify as central cities, because they are at least one-third the size of the metropolitan statistical area's largest city and meet the two commuting requirements.

Complete bathrooms. A housing unit is classified as having a complete bathroom if it has a room with a flush toilet, bathtub or shower, a sink, and hot and cold piped water. All facilities must be in the same room to be a complete bathroom. A half bathroom has either a flush toilet or a bathtub or shower, but does not have all the facilities for a complete bathroom.

Cooling degree day. Each degree that the average temperature for a day is above 65 degrees Fahrenheit produces one cooling degree day (CDD). For example, if the maximum temperature is 80 degrees $F$ and the minimum temperature is 62 degrees $F$, the average temperature for the day is 71 degrees, resulting in six cooling degree days. A day when the average temperature is 65 or less has zero cooling days.

This information on degree days was provided by the National Oceanic and Atmospheric Administration (NOAA). Each sample unit was assigned heating and cooling degree days using average NOAA data for counties. The categories represent the total heating and cooling degree days for the entire year.

## Description of area within 300 feet.

Prior to 1997, the interviewer, through personal observation, marked all of the following categories that describe the area within 300 feet of the building in which the sample unit is located. The interviewer's best estimate of the distance was considered to be acceptable. In 1997, the respondent was asked. The categories include
single-family detached houses; single-family atached houses or low-rise (1-3 story) multiunit buildings; mid-rise (4-6 story) multiunit buildings; high-rise ( 7 -or-more story) multiunit buildings; and mobile homes, excluding campers. The category "Commercial, institutional, industrial building(s)" includes all varieties of nonresidential structures in offices, hospitals, prisons, water treatment plants, factories, parking garages, churches, barns, junkyards, etc. "Residential parking lots" excludes driveways of singlefamily homes and parking garages where parking is on more than one level. "Body of water" refers to lakes, streams, reservoirs, etc. Swimming pools, temporary pools of water, etc., are excluded. "Open space, park, farm, or ranch" includes cemeteries, golf courses, forest preserves, vacant lots, undeveloped land, airport land, school fields, etc. The category " $4+$ lanes highway, railroad, or airport" refers to highways of four lanes or more, railroad tracks, and airports.

Dividends. a sum of money paid to shareholders of a corporation out of earnings, or monies received as a bonus.

Duration of Vacancy. The statistics on duration of vacancy refer to the length of time (in months) from the date the last occupants moved from the housing unit to the date of the interview. The data, therefore, do not provide a direct measure of the total length of time that units remained vacant. For newly constructed units that have never been occupied, the duration of vacancy is counted from the date construction was completed. For recently converted or merged units, the time is reported from the date that the conversion or merger was completed.

## Equipment

This item refers to selected equipment that is in working order and for the household's exclusive use. If there are two or more of the specified appliances in the housing unit, the age of the newest is reported. There was a questionnaire change in 1997, and so 1997 figures may not be comparable to previous years.

Complete kitchen facilities. A housing unit is considered to have complete kitchen facilities when it has all of the following for the exclusive use of the occupants of the unit: (1) an installed kitchen sink, (2) burners and (3) a mechanical refrigerator. Quarters with only portable cooking equipment are not considered as having a range
or cookstove. An icebox is not included as a mechanical refrigerator. The kitchen facilities are for the exclusive use of the occupants when they are used only by the occupants of one housing unit, including lodgers or other unrelated persons living in the unit.

Vacant units are counted as lacking complete kitchen facilities if one or more of the facilities is absent regardless of what will be present when new occupants move in.

Kitchen sink. The sink must be in the unit or on an enclosed porch, but does not have to be in the kitchen. A bathroom sink does not count as a kitchen sink.

Refrigerator. The refrigerator must be a working mechanical refrigerator. Iceboxes are not counted. The data show whether the equipment is less than 5 years old.

Burners and Oven. The cookstove or range does not have to be mechanical. For example, it can be a wood-burning stove. Microwaves are included in the count of ovens, although toaster ovens are not. Portable burners are excluded from the count of cooking burners. The data show whether the equipment is less than 5 years old.

Burners only. These units have burners but no oven. Portable burners are excluded from the count of cooking burners. The data show whether the equipment is less than 5 years old.

Oven only. These units have an oven but no burners. The cookstove or range does not have to be mechanical. For example, it can be a woodburning stove. Microwaves are included in the count of ovens, although toaster ovens are not. The data show whether the equipment is less than 5 years old.

Neither burners nor oven. These units have neither burners nor an oven, meaning that they have neither a mechanical nor non-mechanical cookstove or range, microwave, or cooking burners. They may, however, have a toaster oven or portable burners, as these items are not included in the count of burners or ovens.

Dishwasher. All mechanical dishwashers are included except counter-top dishwashers. The data show whether the equipment is less than five years old.

Washing machine. The washing machine must be mechanical. A wringer washing machine that must be plugged in to run is included in this count. The data show whether the equipment is less than five years old.

Disposal in kitchen sink. Only garbage disposals in working order or only temporarily out of service are included. The data show whether the equipment is less than five years old.

Clothes dryer. Clothes dryer must be mechanical. Excluded from the count are hand-operated wringers, hand-turned open dryers, and other hand-operated devices. The data show whether the equipment is less than five years old.

Air conditioning. Air conditioning is defined as the cooling of air by a refrigeration unit. Excluded are evaporative coolers, fans, or blowers that are not connected to a refrigeration unit. A room airconditioning unit is an individual air conditioner that is installed in a window or an outside wall and generally intended to cool one room, athough it may sometimes be used to cool several rooms. A central system is a central installation that airconditions the entire housing unit. In an apartment building, a central system may cool all apartments in the building; each apartment may have its own central system; or there may be several systems each providing central air conditioning for a group of apartments. A central installation with individual room controls is a central air-conditioning system.

External building conditions. The statistics presented are restricted to multiunits. The external condition of the building that contains the sample unit was determined by interviewer doservation, as visible from the front of the building or the roadway. The categories were grouped as follows: roof, walls, windows, and foundation.

Roof. A "sagging roof" is a defect indicating continuous neglect, or deep or serious damage to the structure. Only roofs with substantial sagging were included. "Missing roofing material" includes rotted, broken, loose, or missing shingles, tiles, slate, shake, tin, etc., caused by extensive damage from fire, storm, or serious neglect. "Hole in roof" occurs when the missing roof materials expose the interior of the unit directly to the elements. Holes caused by construction activity were not counted unless the construction had been abandoned. "Could not see roof" occurs when possible situations such as a high tree,
evening interviews, or a flat roof prevent the roof from being visible.

Walls. "Missing bricks, siding, or other outside wall material" applies to the exterior walls (including chimney) of the structure. Those defects may have been caused by storm, fire, flood, extensive neglect, vandalism, and so forth. Materials may include clapboard, siding, shingles, boards, brick, concrete, stucco, etc. The missing materials do not necessarily expose the interior of the unit openly to the elements. Missing materials resulting from construction activity were not counted unless construction had been abandoned. "Sloping outside walls" are a critical defect indicating continuous neglect or serious damage to the structure. Only walls with substantial sagging were included.

Windows. "Boarded-up windows" have been sealed off to protect against weather or entry and include windows and/or doors covered by board, brick, metal, or some other material. "Broken windows" indicate several broken or missing window panes. "Bars on windows" are to protect against unlawful entry. The condition of the windows has no bearing on this item. The bars can be vertical, horizontal, a metal grating, etc. Windows completely covered with metal sheeting are not included in this category.

Foundation crumbling or has open cracks or holes. This category includes large cracks, holes, and rotted, loose, or missing foundation material.

Could not see foundation. This occurs when landscaping, night interviewing, or some other reason prevents visibility for observation.

Family or primary individual. Housing units are occupied by either families or primary individuals. The term "family" refers to householder and all (one or more) other persons living in the same household who are related to the householder by blood, marriage, or adoption. If the householder lives alone or with nonrelatives only, then the householder is considered a primary individual.

Married couples related to the householder of a family are included in the family and are not considered as separate families unless they reside in separate living quarters. A lodger, servant, or other person unrelated to the householder is considered a member of the household, but not of the family.

Food stamps. These data are restricted to families and primary individuals with total incomes of $\$ 25,000$ per year or less. Food stamps are gov-ernment-issued coupons that can be used to purchase food. The food stamp program is a joint Federal-State program that is administered by State and local governments.

Heating degree day. Each degree that the average temperature for a day is below 65 degrees Fahrenheit produces one heating degree day (HDD). For example, if the maximum temperature is 70 degrees $F$ and the minimum temperature is 52 degrees $F$, the average temperature for the day is 61 degrees, resulting in four heating degree days. A day when the average temperature is 65 or more has zero heating days.

This information on degree days was provided by the National Oceanic and Atmospheric Administration (NOAA). Each sample unit was assigned heating and cooling degree days using average NOAA data for counties. The categories represent the total heating and cooling degree days for the entire year.

Heating equipment. Data shown are for the main heating equipment. Only one type of equipment was reported as the "main heating equipment." Warm-air furnace refers to a central system that provides warm air through ducts leading to various rooms. Steam or hot water system refers to a central heating system in which heat from steam or hot water is delivered through radiators or other outlets. It also includes solarheated hot water that is circulated throughout the home. An electric heat pump refers to a heatingcooling system that uses indoor and outdoor coils, a compressor, and a refrigerant to pump heat in during the winter and pump out heat during the summer. Only heat pumps that are centrally installed with ducts to the rooms are included in the category. Built-in electric units refers to units permanently installed in floors, walls, ceilings, or baseboards. A floor, wall, or other built-in hot-air unit without ducts delivers warm air to the room right above the furnace or to the room(s) on one or both sides of the wall in which the furnace is installed.

Room heaters with flue include nonportable room heaters in the wall or free standing heaters that burn liquid fuel, and which are connected to a flue, vent, or chimney to remove smoke and fumes. Room heaters without flue include any room heater that burns kerosene, gas, or oil, which does not connect to a flue, vent, or chimney. Portable electric heaters include heat-
ers that receive current from an electrical wall outlet. Stoves refer to ranges, stoves, or Franklin stoves that burn wood, coal, or other solid fuel. Fireplaces with inserts have a fan-forced air circulation system to force the heat into the room. A fireplace without inserts or with only glass door fire screens or fire backs inserted in the back of the fireplace to passively reflect heat is included in the category "fireplace without inserts."

For vacant housing units from which the heating equipment had been removed, the equipment used by the last occupants was to be reported.

Heating equipment breakdowns. For breakdowns of heating equipment, statistics are shown for housing units occupied by the householder during the winter prior to the interview. The data are classified by whether the housing unit was uncomfortably cold for 24 hours or more, the number of times equipment breakdowns occurred lasting 6 hours or more, and causes for the breakdowns.

The heating equipment is broken down if it is not providing heat at its normal heating capacity through some fault in the equipment. Utility interruptions occur when there is a cut off in the gas, electricity, or other fuel supplying the heat. Inadequate heating capacity refers to heating equipment that is providing heat at its normal capacity, but the housing unit is still too cold for its occupants. Inadequate insulation refers to air drafts through window frames, electrical outlets, or walls that are cold.

Householder. The householder is the first household member 18 years old or over and is the owner or renter of the sample unit. If no household member occupying the sample unit owns or rents the unit, the householder is the first household member listed who is 18 years old or older. In cases where no household member listed owns or rents the unit or is 18 years or older, the first household member listed is the householder.

Housing units. A housing unit is a house, an apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which have direct access from the outside of the building or through a common hall which is used or intended for use by the occupants of another unit or by the general public. The occupants may be
a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements. For vacant units, the criteria of separateness and direct access are applied to the intended occupants whenever possible. If the information cannot be obtained, the criteria are applied to the previous occupants. Both occupied and vacant housing units are included in the housing inventory, except that tents, caves, boats, railroad cars, and the like are included only if they are occupied.

Income. The statistics on income in the Components of Inventory Change are based on the respondent's reply to questions on income for the 12 months prior to the interview and represent the sum of the amounts reported for wage and salary income, self-employment income, interest or dividends, Social Security or railroad retirement income, public assistance or welfare payments, alimony or child support, and all other money income. This figure represents the amount of income received before deductions or personal income taxes, Social Security, union dues, bond purchases, health insurance premiums, Medicare deductions, etc. Medians for income are rounded to the nearest hundred dollars.

In this report, amounts are shown for the money income of the household (the sum of the income of the householder and all household members 14 years and over).

Income Sources of Families and Primary Individuals. In this report, statistics are shown for the income sources of families and primary individuals occupying the housing unit (the sum of the income of the householder and all other related members 14 years old and over, or the income of the primary individual). Wage or salary income is defined as the total money earnings received for work performed as an employee at any time during the 12-month period prior to the interview. It includes wages, salary, piece-rate payments, commissions, tips, cash bonuses, and Armed Forces pay.

Wages and salaries were majority of income. More than 50 percent of the total income reported by the family/primary individual was in the form of wages or salaries as defined above.

2 or more people each earned over 20\% of wages and salaries. At least two persons in the family (defined as the householder and all other related members 14 years old and over) individu-
ally earned more than 20 percent of the total wages and salaries earned by the entire family.

Business, farm, or ranch income is defined as money income received from a business, professional practice, partnership, farm, or ranch. Social Security or pensions include cash receipts of Social Security pensions; survivors' benefits; disability insurance programs for retired persons, dependents of deceased insured workers, or disabled workers; and deductions for Medicare and health insurance premiums. Cash receipts of retirement, disability, and survivors' benefit payments made by the U.S. Government under the Railroad Petirement Act are also included. Separate payments received for hospital or other medical care are not included.

Also included on the table are periodic payments from interest or dividends; net rental income (or loss) from property rentals and net receipts from roomers or boarders; public assistance or welfare payments that include cash receipts received from public assistance programs, such as old age assistance, aid to families with dependent children, and aid to the blind or totally disabled; unemployment insurance benefits, workmen's compensation, cash benefits, and periodic payments by the Veteran's Administration to disabled veterans. The table also includes alimony or child support from persons who are not members of the household and income from other sources, including money income received from sources such as net royalties, net gambling gains, public or private pensions, periodic receipts from insurance policies or annuities, and non-service scholarships and fellowships.

Receipts from the following sources were not included as income: Value of income "in kind," such as free living quarters, housing subsidies, food stamps, or food produced and consumed in the home; money received from the sale of property (unless the recipient was engaged in the business of selling such property); money borrowed; tax refund; withdrawal of bank deposits; accrued interest on uncased savings bonds; exchange of money between relatives living in the same household; gifts of money; and lump-sum payments for inheritances, insurance policies, estates, trusts, gifts, etc.

The income statistics and the characteristics of the household refer to different periods in time. Income data refer to the 12 months prior to the interview, whereas the household charac-
teristics refer to the date of interview. Thus, family or household income does not include amounts received by persons who were members of the family during all or part of the income period if these persons no longer resided with the family at the time of the interview. On the other hand, family or household income includes income reported by persons who did not reside with the household during the income period but who were members at the time of the interview. For most households, however, the income reported was received by persons who were members of the household throughout the income period.

There may be significant differences in the income data between the American Housing Survey and other Census Bureau surveys and censuses. For example, the time period for n come data in the American Housing Survey refers to the 12 months prior to the interview while other income data generally refer to the calendar year prior to the date of the interview. Additional differences in the income data may be contributed to factors such as the various ways income questions are asked, the sampling variability and nonsampling errors between the American Housing Survey and other Census Bureau surveys and censuses, survey procedures and techniques, and processing procedures.

Interest. Payments made in return for investment or loan. In this case, interest is money received by the respondent, not paid by the respondent.

Lodgers. Counts of lodgers are restricted to households with members unrelated to the householder, and who are 14 years of age and over and are not co-owners, co-renters, or children of co-owners or co-renters who pay rent to another household member.

Lot size. These numbers include all connecting land that is owned or rented with the home. Excluded are two-or-more-unit buildings and two-or-more-unit mobile homes. Median lot size is shown to hundredths of an acre.

Main House Heating Fuel. Electricity is generally supplied by means of above or underground electric power lines. Piped gas is gas transported through underground pipes from a central system to serve the neighborhood. Bottled gas is pressurized gas stored in tanks or bottles that are filled or exchanged when empty. Fuel oil is heating oil normally supplied by truck to a storage tank for use by the heating system. Kerosene or
other liquid fuel includes kerosene, gasoline, alcohol, and other similar combustible liquids. Coal or coke refers to coal or any coal derivative usually delivered by means of truck. Wood refers to the use of wood or wood charcoal, etc., as a fuel. Solar energy refers to the use of energy available from sunlight as a heating fuel source. Other includes briquettes made of pitch and sawdust, coal dust, waste material such as corncobs, purchased steam, or any other fuel not listed.

Mobile homes. A mobile home is defined as a housing unit that was originally constructed to be towed on its own chassis. It may also have permanent rooms attached at its present site, or other structural modifications. The term does not include prefabricated buildings, modular homes, travel campers, boats, or self-propelled vehicles such as motor homes. Some people use the terms trailer or manufactured housing in the same sense as mobile homes.

Metropolitan statistical areas. Metropolitan statistical areas (MSAs) shown in the American Housing Survey are defined by the Office of Management and Budget. By current standards, as published in the Federal Register on January 3 , 1980, an area qualifies for recognition as an MSA in one of two ways: If there is a city of at least 50,000 population, or a Census Bureaudefined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). Except in the New England States, an MSA is defined in terms of entire counties. In New England, MSAs are composed of cities and towns. In addition to the county containing the main city, additional counties are included in an MSA if they are socially and economically integrated with the central county. An MSA may contain more than one city of 50,000 population and may cross state lines.

Monthly housing costs. Monthly housing costs for owner-occupied units are the sum of monthly payments for all mortgages or installment loans or contracts; real estate taxes (including taxes on mobile homes or trailer sites, if the site is owned); property insurance; homeowner's association fee; cooperative or condominium fee; mobile home park fee; land rent; utilities (electricity, gas, water, and sewage disposal); fuels (oil, coal, kerosene, wood, etc.); and garbage and trash collection. Monthly housing costs are not computed for households with a mortgage or similar debt that failed to report the amount of their loan or contract payment.

Monthly housing costs for renters include the contract rent plus the estimated average monthly cost of utilities (electricity, gas, water, and sewage disposal); fuels (oil, coal, kerosene, wood, etc.); property insurance; mobile home land rent; and garbage and trash collection if these items are paid for by the renter (or paid for by someone else, such as a relative, welfare agency, or friend) in addition to rent. Renter housing units occupied without payment of cash rent are shown separately as no cash rent. Monthly housing costs for vacant for-rent housing units include rent asked.

Mortgage payment. One of a series of payments, including principal and interest, to a loan agency holding the note on a real property.

Multiunit structure. A building or mobile home containing two or more units, such as an apartment building. In determining the number of housing units in a structure, all units, both occupied and vacant, are counted.

No cash rent. These are units that are occupied without payment of cash rent.

## Number of single children under 18 Years

 Old. Single children include all persons under 18 years of age, who may or may not be related to the householder and who are not married (i.e., widowed, divorced, separated, or never married) at the time of the interview.Occupied Housing Units. A housing unit is classified as occupied if there is at least one person who lives in the unit at the time of the interview and usually lives in it, or if the occupants are only temporarily absent, for example on vacation. However, if the unit is occupied entirely by persons with a usual residence elsewhere, the unit is classified as vacant. By definition, the count of occupied housing units is the same as the count of households.

Other buildings vandalized or with interior exposed. Prior to 1997, the statistics presented are based on the interviewer's personal observation. In 1997, the respondent was asked. A unit is considered to be vandalized if it has most of the visible windows broken, doors pulled off, been badly burned, words or symbols written on it, portions of the roof missing or gone, or in some other way has the interior exposed to the elements.

Overall opinion of structure. The data presented are based on the respondent's overall opinion of the house or apartment as a place to live. The respondent was asked to rate the structure based on a scale from 1 to 10 , where 10 is the best and 1 is the worst.

Owner or manager lives on property. These statistics are based on the number of rental housing units in structures of two or more units with the owner or resident manager living on the property.

Persons. All persons occupying the housing unit are counted. These persons include not only $\propto$ cupants related to the householder, but also any lodgers, roomers, boarders, partners, wards, foster children, and resident employees who share the living quarters of the householder. The data on persons show the number of housing units occupied by the specified number of persons. The median for persons is rounded to the nearest tenth.

A person is counted at the usual place of residence for that person. This refers to the place where the person lives and sleeps most of the time. This place is not necessarily the same as legal residence, voting residence, or domicile.

Plumbing. Respondents were asked how many bathrooms they had. If they answered one or more, questions on plumbing facilities were not asked; the unit was assumed to have complete plumbing facilities for exclusive use.

Although since 1993 the definition of a bathroom has required hot and cold piped water, a sink, a flush toilet, and a bathtub or shower, this definition was not read to the respondent. Also, nothing in the question required the bathroom to be only for the use of the occupants of the sample unit (exclusive use). It is probable that since 1993 the AHS counted a significant number of units as having complete plumbing for exclusive use that did not, because respondents for these units reported having a bathroom when, in fact, either the bathroom did not contain all plumbing facilities or they were shared by persons living in another unit. Based on previous years' AHS data, it is likely that "completeness" was more of a problem than "exclusive use."

With all plumbing facilities. A bathroom with both hot and cold piped water, a sink, flush toilet, and bathtub or shower for the exclusive use of the occupants of the sample unit.

Lacking some plumbing facilities. The unit lacks one or more of the requisite items for complete plumbing facilities or has all of these items, but the occupants share them with occupants of another unit.

No hot piped water. The unit lacks either hot or cold piped water.

No bathtub nor shower. The unit has neither a bathtub nor a shower for the exclusive use of its occupants.

No flush toilet. The unit lacks a flush toilet for the exclusive use of its occupants. A privy or chemical toilet is not considered a flush toilet. Flush toilets outside the unit were not counted.

No plumbing facilities for exclusive use. The unit meets none of the requirements for complete plumbing facilities. It lacks a bathroom with both hot and cold piped water, a sink, flush toilet, and bathtub or shower for the exclusive use of its occupants.

Property Value. Property value is the respondent's estimate of how much the property (house and lot) would sell for if it were for sale.

Any nonresidential portions of the property are excluded from the cost. For vacant units, property value represents the sale price asked for the property at the time of the interview, and may differ from the price at which the property is sold. Medians for property value are rounded to the nearest dollar.

Race and Origin. The classification of "race" refers to the race of the householder occupying the housing unit. The concept of race as used by the Census Bureau does not denote a clear-cut scientific definition of biological stock. Race was determined on the basis of a question that asked for self-identification of a person's race. For respondents who refused to answer, the interviewer decided on a race only for people she or he saw; others are imputed by computer. For mixed race answers, respondents are asked for the race most closely identified with, for the mother's race, or the first race mentioned is used, in that order of priority.

Hispanic. The classification "Hispanic" refers to the origin of the householder occupying the housing unit. Hispanic origin was determined on the basis of a question that asked for selfidentification of person living in the unit who were

Hispanic or Spanish American. Hispanic persons may be of any race. Hispanic is considered an ethnic origin rather than a race and is tallied separately. Most Hispanics counted themselves as White, but some counted themselves as Blacks or other categories.

## Regions

Northeast. Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, and New Jersey;

Midwest. Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, lowa, Missouri, Kansas, Nebraska, North Dakota, and South Dakota;

South. Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee, Kentucky, Arkansas, Louisiana, Oklahoma, and Texas;

West. Montana, Wyoming, Colorado, New Mexico, Arizona, Utah, Idaho, Alaska, Washington, Oregon, Nevada, California, and Hawaii.

Rent reductions. Respondents reporting no subsidy or income reporting do not receive any type of housing subsidy, nor are they required to report their income as a condition of determining rent amount. These units may, however, be subject to rent control, meaning that the amount of increase in rent is regulated by law. The jurisdiction, State or local, mandates that percentage rent increases are set and must be approved by a board, agency, department, division, office, etc. If a unit is not subject to rent control, the owner may voluntarily reduce the rent.

A housing unit is classified as being in a public housing project if the structure in which the unit is located is owned by any local or State government agency, such as a housing and redevelopment authority or a housing development agency, and qeerated as public housing. These organizations may receive subsidies from the Federal or State government, but the local agency owns the property.

A housing unit is classified as being subsidized if under certain programs the respondent pays a lower rent because a Federal, State, or local government program pays part of the cost of construction, building mortgage, or operating expenses. These programs include (1) the rental assistance program where part of the rent for low-income families occupying the rental housing units is paid by the Department of Housing and

Urban Development (HUD), (2) the FHA interest subsidy programs for rental and cooperative housing for low-income families, (3) the rent supplement program where part of the rent for lowincome families occupying certain types of HUDassisted rental housing projects is paid by the FHA, and (4) the direct loan program of HUD for housing the elderly. Units requiring income verification as a condition of determining rent are subsidized units.

Rooms. Respondents were asked for a count of each specific type of room. The answers to these questions are then added together in the tabulations to provide a total count of rooms. The statistics on rooms are for the number of housing units with a specified number of rooms. Rooms counted include whole rooms used for living purposes, such as bedrooms, living rooms, dining rooms, kitchens, recreation rooms, permanently enclosed porches that are suitable for year-round use, lodgers' rooms, and other finished and unfinished rooms. Also included are rooms used for offices by a person living in the unit. The median for rooms is rounded to the nearest tenth.

A dining room, to be counted, must be a separate room. It must be separated from adjoining rooms by built-in floor-to-ceiling walls extending at least a few inches from the intersecting walls. Movable or collapsible partitions or partitions consisting solely of shelves or cabinets are not considered built-in walls.

## Selected amenities:

Porch, deck, balcony, or patio. The porch, deck, balcony, or patio must be attached to the sample unit, not just to the building or free standing. Porches may be enclosed or open.

Usable fireplace. Excluded are the following: fireplaces that have been blocked off or whose chimney or flue have been filled, decorative or artificial fireplaces, and Franklin stoves. Freestanding fireplaces are included in this item.

Separate dining room. A separate dining room is an area separated from adjoining rooms by a built-in, floor-to-ceiling wall extending at least a few inches from its intersecting wall. Built-in walls do not include movable or collapsible partitions or partitions consisting solely of shelves and cabinets.

With two or more living rooms, recreation rooms, etc. It includes family rooms, dens, recreation rooms, and/or libraries.

Garage or carport. The garage or carport must be on the same property, but does not have to be attached to the house. Off-street parking applies to both owners and renters and is considered to be a driveway or parking area, or for renters, lot privileges that are paid for as part of the rent.

## Selected deficiencies:

Signs of rats. The statistics on signs of rats refer to respondents who reported seeing rats or signs of rats inside the house or building during the last 3 months or while the household was living in the unit if less than 3 months. Signs of rats includes droppings, holes in the wall, or ripped or torn food containers.

Holes in floors. Data are shown on whether there are holes in the interior floors of a housing unit. The holes do not have to go all the way through to a lower floor or to the exterior of the unit. The holes must be large enough to cause someone to trip.

Open cracks or holes (interior). Statistics are presented on whether or not there are open cracks or holes in the interior walls or ceilings of the housing unit. Included are cracks or holes that do not go all the way through to the next room or to the exterior of the housing unit. Hairline cracks, or cracks that appear in the walls or ceilings but are not large enough to insert the edge of a dime, or very small holes caused by nails or other similar objects are not considered to be open cracks or holes.

Broken plaster or peeling paint (interior). The area of peeling paint or broken plaster must be on the inside walls or ceilings, and at least one area of broken plaster or peeling paint must be larger than 8 inches by 11 inches.

Electric wiring. A housing unit is classified as having exposed electrical wiring if the unit has any wiring that is not enclosed either in the walls or in metal coverings, or if the unit has any wiring outside the walls enclosed in some material other than metal. Only finished areas of the unit are included. Excluded from the tabulations are $甲$ pliance cords, extension cords, chandelier cords, and telephone antenna or cable TV wires.

Electric wall outlets. A housing unit is classified as having rooms without electric wall outlets if there is not at least one working electric wall outlet in each room of the unit. A working electric wall outlet is one that is in operating condition; i.e., can be used when needed. If a room does not have an electric wall outlet, an extension cord used in place of a wall outlet is not considered to be an electric wall outlet.

## Selected Physical Problems:

Moderate physical problems. A unit has moderate physical problems if it has any of the following five problems, but none of the severe problems.

Plumbing. Units reporting problems with their plumbing facilities were counted for this category if on at least three occasions during the last 3 months or while the household was living in the unit, if less than 3 months, all the flush toilets were broken down at the same time for 6 hours or more.

Heating. Having unvented gas, oil, or kerosene heaters as the primary heating equipment.

Upkeep. Having any three or four of the overall list of six upkeep problems mentioned under $æ$ vere physical problems.

Hallways. Having any three of the four hallway problems mentioned under severe physical problems.

Kitchen. Lacking a kitchen sink, refrigerator, or burners inside the structure for the exclusive use of the unit.

Severe Physical Problems. A unit has severe physical problems if it has any of the following five problems:

Plumbing. Lacking hot or cold piped water or a flush toilet, or lacking both bathtub and shower, all inside the structure for the exclusive use of the unit.

Heating. Occupants having been uncomfortably cold last winter for 24 hours or more because the heating equipment broke down, and it broke down at least three times last winter for at least 6 hours each time.

Electrical. Having no electricity, or all of the following three electric problems: exposed wiring, a room with no working wall outlet; and three blown fuses or tripped circuit breakers in the last 90 days.

Upkeep. Having any five of the following six maintenance problems: water leaks from the outside, such as from the roof, basement, windows, or doors; leaks from inside structure, such as pipes or plumbing fixtures; holes in the floors, holes or open cracks in the walls or ceilings; more than 8 inches by 11 inches of peeling paint or broken plaster; or signs of rats or mice in the last 90 days.

Hallways. Having all of the following problems in public areas: no working light fixtures, loose or missing steps, loose or missing railings, and no elevator.

Sewage disposal. A public sewer is connected to a city, county, sanitary district, neighborhood, or subdivision sewer system. Included are only systems operated by a government body or private organization, with a sewage treatment system serving six or more units. Small sewage treatment plants, which in some localities are called neighborhood septic tanks, are classified as public sewers. A septic tank or cesspool is an underground tank or pit used for disposal of sewage (serving five or fewer units). Since 1993, a chemical toilet, which may be inside or outside the unit, uses chemicals to break down or dissolve the sewage. Housing units for which sewage is disposed of in some other way are included in the "other" category.

Sewage disposal breakdowns. The data on breakdowns in the means of sewage disposal are limited to housing units in which the means of sewage disposal was a public sewer, septic tank, or cesspool. Breakdowns refer to situations in which the system was completely unusable. Examples include septic tank being pumped because it no longer perked, tank collapsed, tank exploded, sewer main broken, sewer treatment plant not operating as a result of electrical failure or water service interruptions, etc.

Data on breakdowns are shown if they occurred in the 3 months prior to the interview or while the household was living in the unit if less than 3 months, and if the breakdown lasted 6 consecutive hours or more. Housing units with a
breakdown in sewage disposal are also classified according to the number of breakdowns.

Site Placement. This item is collected for mobile homes. "Site" refers to location (other than the manufacturer's or dealer's lot) and not necessarily a mobile home park site. The mobile home was not necessarily occupied at each site, as long as it was set up for occupancy.

Square footage of unit. Housing size is shown for single-family detached housing units and mobile homes. Excluded from the calculation of square footage are unfinished attics, carports, attached garages, porches that are not protected from the elements, (i.e., screened porches), and mobile home hitches. Both finished and unfinished basements are included. Median square footage is rounded to the nearest foot. Square footage is based on the respondent's estimate of the size of the unit. If the respondent did not know the square footage, the interviewer measured the outside dimensions of the unit. Preliminary evaluation indicates that this item is somewhat unreliable.

Stories in structure. The statistics presented are restricted to multiunits. Finished attics are included in the number of stories. Unfinished attics are not. For split levels and bi-levels, the number of stories is determined by the highest number of floors that are physically over each other.

Suburbs. Suburbs are defined in the AHS as the portion of each metropolitan area that is not in any central city.

Suitability for year-round use. For vacant housing units that were not intended for yearround use (i.e., seasonal and migratory), the respondent was asked whether the construction and heating of the housing unit made it suitable for the unit to be occupied on a year-round basis. A housing unit is suitable for year-round use if it is built as a permanent structure, properly equipped and insulated for heating as necessitated by the climate, and if it has a heating system that would be adequate during extended cold periods.

Supplemental Security Income (SSI). A federal welfare cash benefit for disabled low income individuals.

Tenure. A housing unit is owner-occupied if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. Also a cooperative or condominium unit is owner-occupied only if the owner or co-owner lives in it. All other $\propto$ cupied housing units are classified as renteroccupied, including housing units rented for cash rent and those occupied without payment of cash.

Time Shared Units. This item is restricted to vacant housing units, including UREs. Time sharing is a form of ownership in which a single property is owned by multiple owners. Each is entitled to occupy the unit for a limited period of time during a specific time of the year. The number of years of ownership may vary depending on the terms of the contract. Participants in timesharing ownership usually, but not always, receive a deed of ownership.

Type B non-interview. These units are not eligible for an interview at present but could become eligible for an interview in the future (e.g., unit currently is for nonresidential use, unoccupied site for mobile home, unit under construction, unit severely damaged by fire). Note that vacant units and units occupied entirely by people with URE are not considered non-interviews. Type B noninterviews will be revisited each survey year, and if they become housing units again, they will be interviewed.

Units in structure. In determining the number of housing units in a structure, all units, occupied or vacant, were counted. The statistics are presented for the number of housing units, not the number of residential structures.

A structure either has open space on all sides or is separated from other structures by dividing walls that extend from ground to roof. Structures containing only one housing unit are further classified as detached or attached.

A one-unit structure is detached if it has open space on all sides, even though it has an adjoining shed or garage. A one-unit structure is attached if it has one or more walls extending from ground to roof that divide it from other adjoining structures and does not share a furnace or boiler with adjoining structures, such as in row houses, townhouses, etc.

Mobile homes and trailers are shown as a separate category. When one or more rooms have been added to a mobile home or trailer, it is classified as a mobile home.

Urban and rural residences. As defined for the 1980 census, urban housing comprises all housing units in urbanized areas and in places of 2,500 or more inhabitants outside urbanized aeas. More specifically, urban housing consists of all housing units in (a) places of 2,500 or more inhabitants incorporated as cities, villages, boroughs (except in New England States, New York, and Wisconsin), but excluding those housing units in the rural portions of extended cities; (b) census designated places of 2,500 or more n habitants; and (c) other territory, incorporated or unincorporated, included in urbanized areas. Housing units not classified as urban constitute rural housing. Information on the historical development of the urban-rural residence definition appears in the 1980 Census of Population report, Characteristics of the Population, Number of Inhabitants. PC80-1-A.

Urbanized areas. The major objective of the Census Bureau in delineating urbanized areas is to provide a better separation of urban and rural housing in the vicinity of large cities. In the 1980 census, an urbanized area comprised an incorporated place and adjacent densely settled (1.6 or more people per acre), surrounding area that together had a minimum population of 50,000 . For more information on urbanized areas, refer to the 1980 Population Census PC(1)-A reports.

Urban fringe. These units are located in areas that are classified as either urbanized suburbs or non-metropolitan urbanized areas.

Other urban. These units are located in areas that are classified as either other urban suburbs or other non-metropolitan urban areas.

URE. Units for which present occupants have a Usual Residence Elsewhere. These units would include, for example, a temporary or seasonal home.

Vacant housing units. A housing unit is vacant if no one is living in it at the time of the interview, unless its occupants are only temporarily absent. In addition, a vacant housing unit may be one that is occupied entirely by persons who have a usual residence elsewhere (URE).

New housing units not yet occupied are classified as vacant housing units if construction has reached a point where all exterior windows and doors are installed and final usable floors are in place. Vacant units are excluded if unfit for human habitation; that is, if the roof, walls, win-
dows, and/or doors no longer protect the interior from the elements, or if there is positive evidence (such as a sign on the house $\alpha$ block) that the unit is to be demolished or is condemned. Also excluded are quarters being used entirely for nonresidential purposes, such as a store, or an office, or quarters used for storing business supplies or inventory, machinery, or agricultural products.

Water supply stoppage. Water supply stoppage means the housing unit was completely without running water from its regular source. Completely without running water means that the water system servicing the unit supplied no water at all, that is, mo equipment or facility using running water (in kitchen and bathroom sinks, shower, bathtub, flush toilet, dishwasher, and other similar items) had water supplied to it, or all were inoperable. The reasons could vary from a stoppage because of a flood or sorm, to a broken pipe, to a shutdown of the water system, to a failure to pay the bill, or other reasons.

Data on water supply stoppage are shown if they occurred in the 3 months prior to the interview or while the household was living in the unit if less than 3 months, and if the breakdown or failure lasted 6 consecutive hours or more. Housing units with water supply stoppage are also classified according to the number of times the stoppages occurred.

Year householder moved into unit. The data are based on the information reported for the householder and refer to the year of the latest move. Thus, if the householder moved back into a housing unit he or she previously occupied, the year of the latest move was to be reported; if the householder moved from one apartment to another in the same building, the year the householder moved into the present unit was to be reported. The intent is to establish the year the present occupancy by the householder began. The year the householder moves is not necessarily the same year other members of the household move; although, in the great majority of cases, the entire household moves at the same time. The median year householder moved into unit is rounded to the nearest year.

Year structure built. This item refers to when the building was first constructed, not when it was remodeled, added to, or converted. The figures refer to the number of housing units in structures built during the specified periods and in existence at the time of the interview. For mobile homes
and trailers, the manufacturer's model year was assumed to be the year built. The data are dotained from the respondents' answers, rather than from public records and are, therefore, subject to reporting variability. Median year built is rounded to the nearest year.

## Years of school completed by householder.

 The statistics refer to the highest grade of school completed, not to the highest grade attended. For persons still attending school, the highest grade completed is one less than the one in which they are currently enrolled. Regular school refers to formal education obtained in graded public, private, or parochial schools, colleges, universities, or professional schools, whether day or night school, and whether attendance was full or part time. That is, regular schooling is formal education, which may advance a person toward an elementary or high school diploma, college, university, or professional school degree. Schooling or tutoring in other than regular schools is counted only if the credits obtained are regarded as transferable to a school in the regular school system. Householders whose highest grade completed was in a foreign school system or in an ungraded school were instructed to report the approximate equivalent grade (or years) in the regular United States school system. Householders were not reported as having completed a given grade if they dropped out or failed to pass the last grade attended. Education received in the following types of schools is not counted as regular schooling: vocational schools, trade schools, business schools, and noncredit adult education classes.
## Appendix: Algorithm

## Introduction

The Components of Inventory Change ( CINCH ) report measures changes in the housing stock of the United States. These changes are across two different dimensions. One dimension is the physical change in the unit, such as a unit being added or removed from the housing supply. In the discussion below, this is called the status of the unit. The second dimension is a change in the characteristic of the unit or the occupant of the unit, such as the unit being occupied by an owner in one year and by a renter in another year. In the discussion below, this is called the characteristic of the unit. These two perspectives give the analyst a picture of what the housing stock looked like at a particular moment as well as how the stock changed through time.

This series of CINCH reports differs from previously constructed reports. This series uses twoyear pairs of the national American Housing Survey (AHS) to track changes in the stock. In comparison, previous versions of the CINCH compared 1993 and 1991 AHS data with the 1980 Decennial Census.

The goal for this series of reports is to allow the reader to see how the housing stock in the U.S. is evolving over relatively short periods of time. Throughout this description, examples will be given to help illustrate how the results can be interpreted. These examples will be shown in italics.

## The Base Year Concept

When measuring any sort of change across years, one year must be defined to be the "base" year, and the other year as the "comparison" year. For example, this allows the reader to see that there was an increase of X number of units from the base year to the comparison year.

As these reports track both gains and losses to the housing stock, both the early year and the later year of a pair of years must be used as the "base year." The early year is used as a basis to measure losses: what units were in existence at the start but not at the end of the pair of years. The later year is used as a basis to measure additions or gains: What units were in existence at the end but not at the beginning of a pair of years. In addition, the reports provide information on units that have remained unchanged.

## FIRST YEAR AS BASE YEAR -- Losses

When the earlier, or first, year of the two survey years is used as the base year, the report refers to an estimate of housing units that had a particular characteristic in the earlier year and measures how those units changed, if at all. The following descriptions explain how to read the tables when the first year is the base year. These tables usually shows losses from the housing stock.

Present in [early year]: This column indicates the number of housing units with a particular characteristic that were present in the earlier survey year. This provides a "snap-shot" of how many units were present in the earlier year. For example, of the housing units surveyed in the earlier year, how many were "renter-occupied?"

Present in [later year]: This column indicates the number of housing units present in the later survey year that still have the characteristic they had in the earlier year. In other words, this column shows how many units are unchanged in both status and characteristic between the two years. Example: A unit that was renter-occupied in the later year was also renter-occupied in
the earlier year. Because this group is a subset of "Present in [early year]," this number will be less than the "Present in [earlier year]" total.

Changed in Characteristic: A unit is considered to have changed in characteristic if the unit is present in both years of the survey and a given characteristic has changed between the two years. Example: A unit will be listed as changed in characteristic if it was owner-occupied in the base year, but renter-occupied in the comparison year. A change in characteristic means that the unit is physically still present, but a given characteristic of the unit has changed. This change could be in the structure of the unit, such as a change in the number of bedrooms, or in a characteristic of the occupant of the unit, such as tenure (owned vs. rented) status.

Units affected by conversion or merger: This column indicates how many units were affected by a conversion or merger. This number indicates how many units in the earlier year were changed by conversion or merger by the time of the later year. Note that this does not distinguish between units that are converted from one unit to multiple units or units that are merged from multiple units into one unit. Example: How many units were in the building before the building was rehabbed if the total number of units changed?

Units resulting from conversion or merger: Of housing units with a particular characteristic in the early year, this column indicates how many units with that characteristic in the later year resulted from a conversion or merger. Example: How many units were in the building after the building was rehabbed if the total number of units changed?

Early Year Mobile Homes Moved Out: Of mobile home units with a particular characteristic, this column indicates how many were moved away from their sites. Due to responses in the survey, this column includes all mobile homes moved away from the original home site, regardless of reason, and does not distinguish whether the mobile home was demolished or merely moved to another location.

Early Year Units Changed to Nonresidential Use: This column shows how many units with a particular characteristic were converted to non-residential use between the earlier and later survey years. These units are detected as a housing inventory loss, yet not as a demolition/ disaster, and not as a mobile home that has moved out of the survey site. In the later survey year the unit is reported as used for "business or storage." These structures have not been permanently removed from the stock and could, theoretically, be reconverted to housing. Example: A structure is a housing unit in the early year, but has been converted to offices by the later year. This structure would count as a change to nonresidential use.

Units Lost Through Demolition or Disaster: Early year housing units with a specific characteristic that were lost through demolition or disaster before the second survey are counted in this column. Example: early year renter-occupied units that were lost through demolition or disaster before the later year survey.

Units Badly Damaged or Condemned: This column reports how many early year units were lost because they were badly damaged or condemned. To qualify as damaged or condemned, a unit must be detected as a loss, but not as a loss due to demolition/disaster, a mobile home moved out, nor as a nonresidential loss. These are units in which occupancy was prohibited in the later year, or where the interior was exposed to elements.

Units Lost in Other Ways: These are early year units with a particular characteristic that were lost from the housing inventory for reasons other than: a demolition/disaster, a mobile home that moved out of a survey site, a nonresidential loss, or a unit lost because it was damaged or condemned. In most of these cases, we do not know how precisely the unit was lost.

Total Additions: This column adds together all of the ways that a unit is considered an addition to the housing inventory. The elements of this column are described later in the formula summary section. These are later year units results from conversions/mergers.

Total Loss: This column is the sum of all the "loss" columns. The elements of this column are described below in the formula summary section.

Net change: This is the result of subtracting the total loss column from the total additions column. The elements of this column are described below in the formula summary section.

## Formula summary

How columns total for losses:

| Present in early year $=$ | Present in later year <br> + Changed in characteristic <br> + Net change |
| :--- | :--- |

| Net change $=$ | Total additions <br>  <br> - Total loss |
| :--- | :--- |

| Total additions $=$ | Later year units resulting from <br> conversion/merger |
| :--- | :--- |

| Total losses $=$ | Early year units affected by <br> conversion/merger <br> + early year mobile homes moved out <br> + early year units changed to non-residential <br> use <br> + Units lost through demolition or disaster <br> + Units badly damaged or condemned <br> + Units lost in other ways |
| :--- | :--- |

## SECOND YEAR AS BASE YEAR -- Additions

When the later year is used as the base year, the report refers to housing units with a particular characteristic in the later year. These are usually additions, as the housing unit did not exist in the early year, but rather entered the housing stock later. In addition, units that did not change are also measured here. Although the later year is the base year, there is general symmetry in the column meanings as when the early year is the base year. These tables are usually measuring additions to the housing stock.

Present in [early year]: This column indicates the number of housing units with a particular characteristic in the later survey year that were also present in the early year with the same characteristic. Example: Of the renter-occupied housing units surveyed in the later year, the number that were renter-occupied in the early year.

Present in [later year]: This column indicates the number of housing units present in the later survey. These units did not necessarily have that same characteristic in the earlier year. This column includes all of the units with a particular characteristic.

Changed in Characteristic: A unit is considered to have changed in characteristic if the unit is present in both years of the survey, and a given characteristic has changed between the two years. Example: A unit will be listed as changing in characteristic if it was owner-occupied in the base year, but renter-occupied in the comparison year. A change in characteristic means that the unit is physically still present, but a characteristic of the unit has changed. This change could be in the structure of the unit, such as a change in the number of bedrooms, or in a characteristic of the occupant of the unit, such as tenure (owned vs. rented) status.

Early Year Units affected by conversion or merger: This column indicates how many units in the earlier year were then changed by conversion or merger by the later year. Note that this column does not distinguish between units that are converted from one unit to multiple units or units that are merged from multiple units into one unit.

Later Year Units resulting from conversion or merger: Of housing units with a particular characteristic in the early year, this column indicates how many units with that same characteristic in the later year resulted from a conversion or merger.

Later Year Mobile Homes Moved In: For mobile home units with a particular characteristic, this column counts how many existed elsewhere for the early year interview but had been moved to a survey site by the later year. Newly constructed mobile homes are counted as new construction and are not included in this column.

Later Year Units Derived from Nonresidential Use: This column indicates how many units with a particular characteristic were derived from non-residential use in the early year. For example, the column captures how many renter-occupied units surveyed in the later year were used for business or storage during the first interview year. These units are detected as additions to the housing stock, built before the earlier interview year and thus are not detected as new construction. Example: A unit which had been office space is returned to use as a dwelling. This unit would be counted as an addition, being converted from non-residential use.

Units Added Through New Construction: This column identifies how many later year housing units with a particular characteristic were added through new construction. These are new units built since the early year. A new mobile home will be counted here and not in the column for mobile homes moved in.

Units Added Through Other Sources: These are later year units with a particular characteristic that were added to the housing inventory but are not considered new construction and were not previously nonresidential. These are units that are additions to the housing stock, but the source is unclear.

Total Additions: This column is the total of all of the additions to the housing stock. The exact elements of this column can be found in the formula summary below.

Total Loss: This column is the sum of all the "loss" columns. The exact elements of this column can be found in the formula summary below. When the later year is the base year, this column will equal the "Early Year Units affected by conversion or merger."

Net change: This is the result of subtracting the total loss column from the total additions column.

## Formula summary

How columns total for additions:

| Present in early year $=$ | Present in later year <br> + Changed in characteristic <br> + Net change |
| :--- | :--- |

| Net change $=$ | Total additions <br>  <br> - Total loss |
| :--- | :--- |

| Total additions $=$ | Later year units resulting from <br> conversion/merger <br> + later year mobile homes moved in <br> + later year units resulting derived from non- <br> residential use <br> + units added through new construction <br> + units added through other sources |
| :--- | :--- |

| Total losses $=$ | Early year units affected by <br> conversion/merger |
| :--- | :--- |

## Appendix: Weighting

## Introduction

In the American Housing Survey, each observation is assigned two weights, the pure weight (PWT variable) and the adjusted weight (WEIGHT variable) which is also known as the "final weight." These weights can be used to create universe level estimates. These weights are used in the creation of the CINCH reports. This appendix provides a brief overview of the procedure used to adjust the weighting.

## Pure Weight

Theoretically, the pure weight is the inverse of the probability of selection and is invariant over time. In reality, the pure weight does vary in the data set, such as when there was the rural oversampling in certain years, and the extra metro sample in 1995. In addition, there are a small number of cases where, for unknown reasons, the pure weight changes. Generally, the pure weight reverts to its previous value in the following year. The pure weight is present on all observations in the AHS.

## Adjusted weight

The adjusted weight is refined by Census each year to account for non-response, overand undersampling, etc. This is the "final" weight used by Census and is used to for the standard AHS reporting on the housing stock. These weights are adjusted and vary in successive AHS data files. This final weight is present only for observations representing units in the housing stock. The weight is not present for a unit that has been removed from the stock.

## Weighting procedure

In this appendix, "base year" is defined as the early year of a pair of years, while "current year" is defined as the later year of a pair of year (e.g. for the 1985-1987 report, 1985 is the base year and 1987 is the current year).

The procedure for adjusting weights is approximately as follows. This is a simplification. The programs can be provided to interested parties.

From the base year perspective, for tables measuring losses:

1. Take the maximum of the pure weights. This step takes the maximum of the pure weights for the pair of years. This primarily addresses the situations where the pure weight changes due to changes in the sample.
2. Sum the base year final weights. This step computes the total number of housing units expected to be present in the base year using the adjusted weight.
3. Remove observations present in only one year. Observations present in only one year, such as the rural oversample, are removed from the data.
4. Compute the ratio of pure weight. To address some of the change in the pure weight, a ratio of the final weight in the base year divided by the pure weight in the base year. This ratio is then applied to the maximum of the pure weights created in Step 1. This new weight is called "pwta."
5. Categorize observations. Observations representing units are categorized in three ways: same (or unchanged) units, changed units that were current year non-interview losses, and changed units that were not current year non-interview losses.
6. Compute second stage ratio. A ratio of:

Total adjusted weight - total number of current year losses
Total number of same units + changed units NOT non-interview losses
is computed. This ratio is used to create CINCH weights that are close to the total adjusted pure weight.
7. Application of second stage ratio to create final CINCH weights. The ratio computed in step 6 is applied to the pwta for same units and changed units that were NOT non-interview losses to create a CINCH weight. All other observations have pwta as their CINCH weight.

From the current year perspective, the computation of a CINCH weight is similar. "Sames" have the same weight as from the base year perspective, new construction is given CINCH weights equal to the final adjusted weights for those observations, and the non-sames are ratio-adjusted to make up the difference. This is described briefly below.

From the current or later year perspective for tables measuring additions, the following occurs:

1. Take the maximum of the pure weights. This step takes the maximum of the pure weights for the pair of years. This primarily addresses the situations where the pure weight changes due to changes in the sample.
2. Sum the current year final weights. This step computes the total number of housing units expected to be present in the current year using the final adjusted weight.
3. Remove observations present in only one year. Observations present in only one year, such as the rural oversample, are removed from the data.
4. Compute total same and new construction. The units that are unchanged (or "same") are held to have the weight as used with the base year being the early year. Their total is computed. Then also the total for new construction is computed based on the final adjusted weight for the observations representing new construction. These weights will be used as the CINCH weight for these observations.
5. Compute the ratio of pure weight. To address some of the change in the pure weight, a ratio of the final weight in the base year divided by the pure weight in the base year. This ratio is then applied to the maximum of the pure weights created in Step 1. This new weight is called "pwtc1." This is only applied to units that are changed in some way.
6. Compute second stage ratio. A ratio of:

Total adjusted weight - (total number of sames and new construction)
Total number of changed units
is computed. This ratio is used to create CINCH weights that are close to the total adjusted pure weight.
7. Application of second stage ratio to create final CINCH weights. The ratio computed in step 6 is applied to the pwtc1 for non-same units to create a CINCH weight. All other observations have the weights used in Step 4 and their CINCH weight.

The estimated number of units on CINCH tables is slightly different from those listed in other publications.
