## 1984 AGRICULTURAL PRICES ANNUAL SUMMARY

The 26th Annual Summary of Agricultural Prices contains the series of prices farmers received for commodities sold as well as prices paid for production input goods and services. Prices are weighted and aggregated into price indexes. These indexes provide measures of relative price changes for agricultural outputs and inputs.

AGRICULTURAL COMMODITY PRICES: Prices received by farmers represent averages received by farmers at the point of first sale for all grades and qualities of the commodity sold. Points of first sale by farmers range from bulk sales at the farm to packed and graded products delivered to a local market. For crops the price refers to all sales, regardless of the year harvested. The average price concept is that price which would result from dividing the total dollars received by all farmers, before any marketing charges are deducted, by the total quantity sold. Contract sales are reported in the month of settlement, not when agreements are made. Transactions are finalized when delivery and payment are completed. Prices are on an "as sold" basis, with the following exceptions: Milk is priced f.o.b. plant or receiving station; Apple and peach prices are equivalent packinghouse-door returns for Oregon and Washington, equivalent returns for bulk fruit at first delivery point in California, and point of first sale for all other States.

Monthly prices are based on all sales of the commodity during the entire month. Exceptions are cottonseed, hay, eggs, and turkeys which are based on the 5-day period centered on the 15th of the month. State commodity prices are estimated for months when 0.5 percent or more of the annual sales occur. Weights for computing monthly United States average prices from State average prices are based on estimated marketings during the month. Milk cow prices are weighted by January 1 inventory numbers.

Season average prices are weighted average prices for crops sold during the marketing season. Marketing seasons are shown on pages 27 and 28. State season average prices are computed by weighting monthly prices by the estimated percentage of sales each month during the marketing season. U.S. season average prices are computed by weighting State season average prices by the estimated quantity sold in each State.

The preliminary season average price estimates for 1984 are based on price data through February 1985 for all crops except potatoes and sweetpotatoes, which are based on data through December 1984, cotton through March 1985, and tobacco through April 1985. Allowances are made for that portion of the crop yet to be marketed during the current marketing year for all crops except cotton.

State and U.S. season average prices exclude Government program payments, but include allowances for unredeemed loans and purchases by the Government, valued at the average loan rate. Monthly prices do not include this allowance. Crop prices which may be affected by this allowance are barley, corn, cotton, dry edible beans, oats, rice, rye, sorghum grain, soybeans, and wheat. Government payments to farmers are included in farm income accounts as a separate item and thus are excluded from price calculations.

Marketing year average prices are weighted average prices for livestock and poultry items. State marketing year average prices are computed by weighting monthly prices by the estimated percentage of sales for each month of the marketing year. U.S. marketing year average prices are computed by weighting State marketing year average prices by the estimated quantity sold in each State. Marketing years for livestock and livestock products are shown on page 30.

Calendar year average prices are unweighted averages of the January through December monthly prices. Calendar year average prices for milk cows at the State level are the simple average of the four quarters. The U.S. calendar year average price for milk cows is computed by weighting the State calendar year average prices by the January 1 inventory of milk cows on farms.

Monthly and season average crop prices for 1983 are final except for fruit. Crop prices for 1984 are subject to revision. These revisions will be published in the monthly issues of Agricultural Prices. Livestock, livestock products and poultry prices are final for both 1983 and 1984. Prices for agricultural commodities may be revised during the Agency's five-year review of production estimates. Changes that result from this review are usually small and, generally, are the result of reweighting State prices to the U.S. level.

AGRICULTURAL INPUTS: The Index of Prices Paid by Farmers measures changes in the prices paid for goods and services used in production of crops and livestock and family living. The index is made up of 5 major components. In terms of total farm expenditures, the production component accounts for nearly 60 percent of the total and the family living component represented by the Bureau of Labor Statistics' Consumer Price Index (CPI-U) accounts for about 30 percent of the index. The remaining three components are: (1) interest charges per acre on mortgage indebtedness secured by farm real estate; (2) taxes payable per acre on farm real estate; and (3) wage rates paid to hired farm labor. Prices Paid Indexes are not seasonally adjusted and there are no adjustments for quality changes.

The two components of a price index are price and quantity. Both prices received and prices paid indexes are fixed weight indexes. Weights for the prices paid indexes are based on average farm expenditures during 1971-73. Indexes are published on a 1977=100 base and a 1910-14=100 base. The Office of Federal Statistical Policy and Standards Directive No. 5 directed that the 1977 base year be in use by January 1982 for Federal Government general-purpose index numbers. The 1910-14=100 base is required under the Agricultural Adjustment Act of 1938 as amended. The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes and Farm Wage Rates on the 1910-14=100 base is called the Parity Index. The Parity Index reflects relative price change but does not take into account the technological advancements and increased productivity of American agriculture.

The number of input items consumed on farms is so extensive that it is not feasible to collect price data for all of the inputs. Therefore, about 200 selected items are priced to represent groups of similar items purchased which make up the major production expenditures.

Prices are collected on a regular schedule. The frequency of the surveys are based on the importance of the items in the index and general price volatility. The following table lists the surveys by month.

Prices Paid Survey Schedule

Survey	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

Items on the questionnaire are described in the simplest way consistent with definite identification. Firms are requested to report the prices for the item most commonly sold which meets the general specification on the questionnaire. Reported data are summarized to State or regional estimates. Then, the State or regional estimates are weighted to a U.S. price. Weights are based on available consumption or expenditure information.

U.S. prices are published in Agricultural Prices in the same month as the survey. State prices are published in the same month of the survey for feed, fuel, and seed in Agricultural Prices and fertilizer prices are published by regions. Regional prices for building materials, farm machinery, farm supplies, pesticides and motor supplies are published only in the Agricultural Prices Annual Summary.

The production input prices published in this Annual Summary are considered final and usually are not subject to revision since additional information is not available for most items. Components of the production index are not likely to be revised since prices are seldom revised. However, the overall Index of Prices Paid Including Taxes, Interest and Wages is subject to change as annual revisions are usually made in the taxes, interest and cash rent and farm services components of the index.

PARITY RATIO: The Parity Ratio is the ratio of the Prices Received Index, 1910-14=100, to the index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes and Wage Rates on a 1910-14=100 base. The Parity Ratio is a measure of price relationships; not a measure of farm income, of farmer's total purchasing power, or of farmer's welfare. The well-being of the farm community depends upon a number of factors other than price relationships such as changes in production efficiency and technology, quantities of farm products sold, and supplementary income, including income from off-farm jobs and federal farm programs.

RATIO: The ratio of the Prices Received Index to the Price Paid Index on the 1977 base provides an indication of the change that has occurred in the prices farmers receive for their commodities relative to the change in the cost of inputs using 1977 as the reference year. When this ratio is greater than 100 percent, it implies that farm commodity prices have increased at a faster rate than farm input prices. When the ratio is less than 100 percent, farm input prices are increasing at a more rapid pace than farm commodity prices.

#### ACKNOWLEDGEMENT

The State, regional and U.S. average prices for agricultural commodities and farm production inputs are based on voluntary reports from agribusiness firms, merchants, dealers and farmers throughout the Nation. These data are collected at regular intervals using mailed inquiries and personal enumeration. The cooperation and support of all the individuals and firms that have provided data is greatly appreciated.
