Agricultural Prices

1989 Summary

AGRICULTURAL PRICES

1989 SUMMARY

The 31st Annual Summary of Agricultural Prices contains the series of prices farmers received for commodities sold as well as prices paid for production input goods and services. Prices are weighted and aggregated into price indexes. These indexes provide measures of relative price changes for agricultural outputs and inputs.

The State, regional, and U.S. average prices for agricultural commodities and farm production inputs are based on voluntary reports from agribusiness firms, merchants, dealers, and farmers throughout the Nation. These data are collected at regular intervals using mailed inquiries, telephone, and personal enumeration. The cooperation and support of all the individuals and firms that have provided data is greatly appreciated.

Estimates of prices received by farmers are published by state for crops (1988-89), vegetables (1987-89), and livestock and poultry (1989). U.S. prices are published for 1984 through 1989. Prices paid by farmers for feed, fuel, and fertilizer are published by region for 1989. U.S. price indexes for both prices received and paid are included for 1979-89.

Crop prices for 1989 are subject to revision. In addition, fruit and vegetable prices for 1988 could change. Prices received for livestock and poultry, and all prices paid are considered final. Price revisions are published in the monthly issues of Agricultural Prices.

* - REGIONAL AVERAGE PRICES FOR 1989

1989 AGRICULTURAL PRICES ANNUAL SUMMARY

AGRICULTURAL COMMODITY PRICES: Prices received by farmers represent monthly and marketing year averages received by farmers at the point of first sale for all grades and qualities of the commodity sold. Points of first sale by farmers range from bulk sales at the farm to packed and graded products delivered to a local market. For crops the price refers to all sales, regardless of the year harvested. The average price concept is that price which would result from dividing the total dollars received by all farmers, before any marketing charges are deducted, by the total quantity sold. Contract sales are reported in the month of settlement, not when agreements are made. Transactions are finalized when delivery and payment are completed. Prices are on an "as sold" basis, with the following exceptions: milk is priced f.o.b. plant or receiving station; fruits and vegetables are covered in detail on page A-2.

MONTHLY PRICES are based on all sales of the commodity during the entire month. Exceptions are hay, eggs, and turkeys which are based on the 5-day period centered on the 15th of the month. State commodity prices are estimated for months when 0.5 percent or more of the annual sales occur. Weights for computing monthly United States average prices from State average prices are based on estimated marketings during the month.

MARKETING YEAR AVERAGE PRICES are weighted average prices for crops, livestock, and poultry items sold during the marketing year. Marketing years are shown on pages A-17 and A-18. State marketing year average prices are computed by weighting monthly prices by the estimated percentage of sales each month during the marketing year. U.S. marketing year average prices for corn, sorghum, oats, barley, wheat, rice, soybeans, flaxseed, sunflower, peanuts, and upland cotton are computed by weighting U.S. monthly prices by monthly marketings for the U.S. marketing year. Other crops, livestock, and poultry are computed by weighting State marketing year average prices by the estimated quantity sold in each State.

PRELIMINARY MARKETING YEAR AVERAGE price estimates for 1989 are based on price data through February 1990 for all field crops except: potatoes and sweetpotatoes -- based on data through December 1989; cotton -- based on data through March 1990; and tobacco -- based on data through April 1990. Marketing years for fruit, vegetables and nuts vary by State and commodity. Allowances are made for that portion of the crop yet to be marketed during the current marketing year for all commodities except cotton.

State and U.S. monthly and marketing year average prices for crops are open-market prices and do not include Government program payments or allowances for unredeemed loans and purchases by the Government. Government payments to farmers are included in farm income accounts as a separate item and thus are excluded from price calculations.

CALENDAR YEAR AVERAGE prices are unweighted averages of the January through December monthly prices. Calendar year average prices for milk cows at the State level are the simple averages of the four quarters. The U.S. calendar year average price for milk cows is computed by weighting the State calendar year average prices by the January 1 inventory of milk cows on farms.

Monthly and marketing year average crop prices for 1988 are final except for fruit. Crop prices for 1989 are subject to revision. These revisions will be published in the monthly issues of AGRICULTURAL PRICES. Livestock, livestock products and poultry prices are final for both 1988 and 1989. Prices for agricultural commodities may be revised during the Agency's five-year review of production estimates. Changes that result from this review are usually small and, generally, are the result of reweighting State prices to the U.S. level.

FRUIT PRICES are a marketing year average for all methods of sale. For a crop sold for both fresh market and processing, the marketing year average price is a weighted average of the fresh and processing price. Monthly prices refer to all fruit sold in a given month regardless of the crop year in which the fruit was harvested.

Prices for fresh fruit are the average prices producers receive at the point of first sale. This is commonly referred to as the **AVERAGE PRICE AS SOLD**. Since the point of first sale is not the same for all producers, prices for the various methods of sale are weighted by the proportionate quantity sold. For example, if in a given State part of the fruit is sold f.o.b. packed by growers, part is sold as bulk fruit at the packinghouse-door, and some

is sold retail at roadside stands, the fresh fruit AVERAGE PRICE AS SOLD is a weighted average of the average price for each method of sale. The exception is fresh fruit sales in California, Washington, New York (apples only) and Oregon (excluding peaches) which are equivalent returns at packinghouse-door. The equivalent packinghouse returns represent adjusted prices. F.o.b. packed prices are adjusted to an equivalent incoming packinghouse door price by subtracting all costs that accumulate between the incoming packinghouse-door and the f.o.b. price. These costs include grading, packing, inspecting fees, selling, and other costs.

Prices for fruit sold for processing are equivalent returns delivered to the processing plant door. Exceptions are cranberries and California olives and clingstone peaches which are priced at the first delivery point.

CITRUS PRICES include revised State and U.S. monthly average prices and equivalent per unit returns together with marketing year average prices for the crop years 1987-88 and 1988-89. These data, together with the September AGRICULTURAL PRICES 1966-87 issues, supplement to the September 1965 issue, supplements to the October 1953-1964 issues and STATISTICAL BULLETIN NO. 322 published in September 1962, bring to date the citrus price bulletin published as a supplement to the November 1952 issue of AGRICULTURAL PRICES.

MARKETING YEAR AVERAGE prices and equivalent returns refer to the prices received by growers for the entire marketing season for any one crop year. The crop year 1987-88 as shown on all citrus tables in this publication refers to the crop which bloomed in 1987 and was marketed during the 1987-88 season. For example, the 1987-88 marketing year average price received by California growers for tangerines refers to the fruit marketed from November 1987 through May 1988. In some States the season may vary a month or two, but a price was estimated only for months with sufficient movement. The following procedure is using the marketing year average price at equivalent packinghouse-door fresh and processed sales to compute State values for commodity groups:

STATE ALL SALES MARKETING YEAR AVERAGE PRICE COMPUTATION PROCEDURE

- Fresh Market Value = Fresh Market Price x Fresh Market Utilization
- Process Market Value = Process Market Price x Process Market Utilization
- "All" Market Value = Fresh Market Value + Process Market Value
- "All" Sales Average Price = "All" Sales Value / "All" Sales Utilization

In a few instances, breakdowns other than marketing channel are used as components for computing an all price. At the U.S. level for tangerines, oranges, and grapefruit as well as all California grapefruit, the prices have been weighted by the size of the containers. Approximate net contents per box are as follows: Grapefruit: Arizona and California Desert Valleys - 64 lbs., other California areas - 67 lbs., Florida - 85 lbs. and Texas - 80 lbs; Lemons - 76 lbs; Limes - 88 lbs.; Oranges: Arizona and California - 75 lbs., Florida - 90 lbs., and Texas - 85 lbs., Tangelos - 90 lbs.; Tangerines: Arizona and California - 75 lbs. and Florida - 95 lbs.; Temples - 90 lbs.

FRESH VEGETABLES: Fresh vegetable prices are all at f.o.b. shipping point levels. Prices for broccoli, carrots, cauliflower, celery and onions may include some processing.

PREFACE

AGRICULTURAL INPUTS: The Index of Prices Paid by Farmers measures changes in the prices paid for goods and services used in crop and livestock production and family living. The index is made up of 5 major components. In terms of total farm expenditures, the production component accounts for nearly 60 percent of the total and the family living component represented by the Bureau of Labor Statistics' Consumer Price Index (CPI-U) accounts for about 30 percent of the index. The remaining three components are: (1) interest charges per acre on mortgage indebtedness secured by farm real estate; (2) taxes payable per acre on farm real estate; and (3) wage rates paid to hired farm labor. Prices Paid Indexes are not seasonally adjusted and there are no adjustments for quality changes.

The two components of a price index are price and quantity. Both prices received and prices paid indexes are fixed weight indexes. Weights for the prices paid indexes are based on average farm expenditures during 1971-73. Indexes are published on a 1977=100 base and a 1910-14=100 base. The Office of Federal Statistical Policy and Standards Directive No. 5 directed that the 1977 base year be in use by January 1982 for Federal Government general-purpose index numbers. The 1910-14=100 base is required under the Agricultural Adjustment Act of 1938, as amended. The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes, and Farm Wage Rates on the 1910-14=100 base is called the Parity Index. The Parity Index reflects relative price change but does not take into account the technological advancements and increased productivity of American agriculture.

The number of input items consumed on farms is so extensive that it is not feasible to collect price data for all of the inputs. Therefore, about 200 selected items are priced to represent groups of similar items purchased which make up the major production expenditures categories.

Items on the questionnaire are described in the simplest way consistent with definite identification. Firms are requested to report the prices for the item most commonly sold which meets the general specification on the questionnaire. Reported data are summarized to regional estimates and then weighted to U.S. prices. Weights are based on available consumption or expenditure information. Average prices with state and local taxes included used in computing the indexes are published in Agricultural Prices in the same month as the survey. Regional prices are published for feed, fuel, and fertilizer. Only U.S. prices are published for the remaining items surveyed.

Production input prices published in this Annual Summary are considered final and usually are not subject to revision since additional information is not available for most items. Components of the production index are not likely to be revised since prices are seldom revised. However, the overall Index of Prices Paid Including Taxes, Interest and Wages is subject to change as annual revisions are usually made in the taxes, interest, and cash rent and farm services components of the index.

PARITY RATIO: The Parity Ratio is the ratio of the Prices Received Index, 1910-14=100, to the index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes and Wage Rates on a 1910-14=100 base. The Parity Ratio is a measure of price relationships; not a measure of farm income, of farmer's total purchasing power, or of farmer's welfare. The well-being of the farm community depends upon a number of factors other than price relationships such as changes in production efficiency and technology, quantities of farm products sold, and supplementary income, including income from off-farm jobs and federal farm programs.

RATIO: The ratio of the Prices Received Index to the Price Paid Index on the 1977 base provides an indication of the change that has occurred in the prices farmers receive for their commodities relative to the change in the cost of inputs using 1977 as the reference year. When this ratio is greater than 100 percent, it implies that farm commodity prices have increased at a faster rate than farm input prices. When the ratio is less than 100 percent, farm input prices are increasing at a more rapid pace than farm commodity prices.

RELATIVE IMPORTANCE

The relative importance of the component indexes that make up the Index of Prices Paid by Farmers, including Interest, Taxes and Farm Wage Rates were annually calculated in June prior to 1986. The prices paid program changed to a quarterly basis, effective March 1986, with the relative importance of component indexes now calculated annually in April. Relative importance is the percent of total contribution that a component makes to the overall Prices Paid Index at a given point in time. The change in relative importance from year to year is determined by the rates of price change for various items in relation to each other. It reflects the impact of the index items at current price levels on the overall index. This may be more or less than the previous year or base weight period as a result of larger or smaller price changes for an item or index compared with other items or indexes.

Quantity weights used for index computation are based on the 1971-73 period. Relative importance in the 1971-73 base period for individual commodities was published in INDEX NUMBERS OF PRICES RECEIVED AND PRICES PAID BY FARMERS, Pr 1-5 (76), May 1976, pages 47-51.

PARITY INDEXES: RELATIVE IMPORTANCE OF COMPONENT INDEXES, 1971-73 AND APRIL 1989 1/

COMMODITY GROUP	RELATIVE IMPORTANCE	
	1971-73 3/	APRIL 1989
	PERCENT	
CONSUMER PRICE INDEX (CPI) 2/	30.4	32.3
PRODUCTION	57.6	54.4

Farm Serv. & Cash Rent	7.4	7.6
TOTAL COMMODITIES	88.0	86.8
INTEREST	4.0	5.8
TAXES	2.8	2.0
FARM WAGE RATES	5.2	5.5
COMMODITIES, INTEREST, AND WAGE RATES	100.0	100.0

- 1/ Data shown indicate the contribution of each component to the prices paid index. The Relative Importance is obtained by multiplying each index value for April 1989 times the base year, 1971-73, percentage weights for each component index and adjusting to equal 100 percent.
- 2/ Beginning in Jan 1977 the Bureau of Labor Statistics (BLS) Consumer Price Index (CPI) was used in place of the USDA-NASS family living index.
- 3/ Same as index weights.
